TITLE: Application of titanium and its alloys as corrosion-resisting materials in titanium dioxide production

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 10, 1962, 87, abstract 101573 ("Lakokrasochn. materialy i ich primeneniye", no. 2, 1962, 60 - 62)

TEXT: Tests of Ti and its alloys were carried out in media specific for TiO_2 production, where the concentration of H_2SO_4 varies from 20 to 94%, and the temperature ranges from 10 to 220°C. To stable alloys belongs Ti and its alloys with 3% Al + 2% V and with 4% Al + 2% V. No traces of corrosion were detected on microsections of these alloys either on the grain boundaries or on the surface of the samples. The increase of the weight during the test results obviously from the formation of an oxide film, which has a good adhesion with the base metal and is insoluble in H_2SO_4 , HNO_3 and HCl. Welded seams on Ti do not corrode. It is shown that σ_{cr} decreases slightly after corrosion tests but the

Application of titanium and its...

rupture takes place not along the welded seam. Microstructure investigations have shown that corrosion of unstable alloys has a "pitting" character and penetrates sometimes into a sample up to 20 mm deep. The corrosion of side surfaces has a "fibrous" character. As a characteristic feature it should be pointed out that during the first 10 - 40 hours the corrosion takes a slow course, and thereafter its rate increases sharply.

TITLE: Electroslag remelting of EI481 chromium-manganese-nickel heat resistant steel

SOURCE: Stal', no. 1, 1967, 39-41

TOPIC TAGS: *chromium manganese nickel steel, heat resistant steel, steel melting, electroslag melting, steel composition, steel mechanical property/EI481 steel*

ABSTRACT:

Cast EI481 high-alloy heat-resistant steel (0.34—0.40% C, 7.5—9.5% Mn, 11.5—13.5% Cr, 7.0—9.0% Ni, 1.1—1.4% Mo, 0.25—0.45% Nb, 1.3—1.6% V, 0.3—0.8% Si) was electroslag remelted under four different slags and tested for chemical composition, nonmetallic inclusions and mechanical properties. The best results were obtained with the use of standard or with 10% lime No. 4 slag of the CaF₂-CaO system. In all cases, electroslag remelting changed only slightly the steel composition. It decreased the content of manganese by 0.04—0.20 abs.% and of vanadium by 0.08 abs.%; the sulfur content decreased by 20—40%, but no substantial decrease was observed in the hydrogen and oxygen contents. The electroslag remelting also decreased

Card 1/2

UDC: 669.187.26

ACC NR: AP7003870

the content of nonmetallic inclusions from 98.7 to 52.3·10⁻⁴% and resulted in more uniform distribution. No significant changes were observed in the mechanical properties of the electroslag remelted metal (all were above the technical requirements) but the anisotropy of the ductility characteristics decreased by 20—40%. In stress-rupture tests at 650°C under a stress of 38 kg/mm², the steel remelted under No. 4 slag failed after 156 hr compared with 35 hr required for conventionally melted steel. Forged parts from electroslag remelted steel had a tensile strength of 112.0—104.0 kg/mm², a yield strength of 74.0—83.7 kg/mm², an elongation of 19.2—24.0%, a reduction of area of 31.2—43.9% and an impact toughness of 4.5—5.5 kg·m/cm². The corresponding figures for forgings of conventionally melted EI481 steel were 60 and 85 kg/mm², 15 and 20%, and 2.5 kg·m/cm². The electroslag remelting of EI481 steel can be recommended for increasing the service life of parts made from this steel. Orig. art. has: 2 tables.

TITLE:

Hydrodynamic properties of poly- β -vinyl naphthalene macro-molecules in benzene

PERIODICAL:

Vysokomolekulyarnyye soyedineniya, v. 4, no. 4, 1962, 540-545

TEXT: Diffusion constants, sedimentation coefficients and intrinsic viscosity of 10 fractions of poly- β -vinyl naphthalene (P- β -VN) in benzene were studied. The Mark - Kuhn - Houwink relations in this solvent were found to have the form $D = 3.5 \cdot 10^{-4} M_{S,D}^{-0.57}$ for the diffusion coefficient, and $[\eta] = 6.6 \cdot 10^{-5} M_{S,D}^{0.71}$ for the intrinsic viscosity. The molecular weight $M_{S,D}$ was determined from Svedberg's equation. The hydrodynamic behavior of P- β -VN, which is determined by viscosity and diffusion, is completely normal and confirms the universal character of the empirical constant $A = \eta_0 D (M[\eta])^{1/3} T^{-1}$. Its mean value was $(3.1 \pm 0.1) \cdot 10^{-10}$ erg/degree. This Card 1/3

S/190/62/004/004/010/019
B117/B138

Hydrodynamic properties of ...

corresponded to the value of this constant determined for other polymers and again confirmed the usual correlation of hydrodynamic properties of P- β -VN during translation and rotation. The estimate of the relation between dimensions of P- β -VN molecules in benzene and their dimensions during free rotation $(\bar{h}^2)_0^{1/2}(\bar{h}^2)_f^{1/2}$, which characterizes the hardness of the molecular structure, made by means of the previously determined swelling parameter (Ref. 9: V. Ye. Eskin, K. Z. Korotkina, Vysokomolek. soyed., 2, 272, 1960) $\alpha^3 = ([\eta]/[\eta])_0 = 1.2$, produced a mean value of 2.6. $(\bar{h}^2)_0^{1/2} = (\bar{h}^2)_D^{1/2}/\alpha$ are undisturbed dimensions of the macromolecule). This amount, which slightly exceeds the corresponding values for most of the linear polymers, showed (e. g. in comparison with polystyrene) that the substitution of the benzene ring by naphthalene increases the thermodynamic hardness of the macromolecule. It was found that the dependence of the diffusion coefficient D on the concentration of one of the P- β -VN fractions with $M = 3.5 \cdot 10^6$ is only slight in CCl₄ and more marked in benzene. This confirms that the dependence on the concentration is mainly determined by the thermodynamic interaction between polymer and solvent. (Ref. 13: V. N. Tsvetkov, S. I.

TITLE: Analytical determination of americium, plutonium, and uranium
using AMP anion exchange resin

SOURCE: Radiokhimiya, v. 7, no. 6, 1965, 728-729

TOPIC TAGS: americium, plutonium, uranium, quantitative analysis, ion
exchange resin

ABSTRACT: The method described for the separation of americium, plutonium, and uranium using AMP ion exchange resin is based on the difference in the degree of sorption of ions of uranium (VI), plutonium (IV) and (III), and americium (III) from hydrochloric acid of different concentrations. The column used was a glass tube 6 cm long and 5 mm in diameter, with a drawn out end. In the determinations, a small amount of sulfuric acid does not interfere with the separation, but nitric acid must be eliminated, since it can promote the reduction of plutonium to the trivalent state. To this end, the solution being analyzed was evaporated to dryness, 10 ml of concentrated HCl was added to the

TITLE: Properties of Siloxane Rubber Vulcanisates Containing Vinyl Groups (SKTV). (Svoystva sulkanizatov siloksanovykh kauchukov, soderzhashchikh vinil'nyye gruppy (SKTV))

PERIODICAL: Kauchuk i Rezina, 1959, Nr 4, pp 3-7 (USSR)

ABSTRACT: Dimethyl siloxane rubber and its vulcanisates are widely used in industry since they possess high thermal stability. In the Soviet Union siloxane rubbers containing vinyl groups were first manufactured in 1956. The present paper describes experiments on the vulcanisation capacity of rubbers containing 1 and 3 mol. % vinyl-ethyl siloxane chains in the dimethyl siloxane polymer chain (SKTV-1 and SKTV-3). Their properties are given in Table 1. This type of rubber can be vulcanised with sulphur in the presence of diphenyl guanidine (DFG), pentaldehyde diamine, cyclohexylethylamine salts of cyclohexyldithiocarbamic acid (Vulkatsit 774), dimethyl diphenyl thiuram disulphide (Vulkatsit 1), triethylene tetramine (TETA), and some aldehyde diamines and also with tetramethyl thiuram disulphide (Tiuram). Vulcanisation proceeded at 160°C in the presence of all the above-mentioned accelerators,

Card 1/3

SOV/138-59-4-2/25

Properties of Siloxane Rubber Vulcanisates Containing Vinyl Groups (SKTV)

except TETA. Using TETA as an accelerator vulcanisation could be carried out in thirty minutes at 140°C (Table 2). Mixtures of SKTV-3 could be vulcanised at a faster rate than SKTV-1 mixtures. Changes in the physico-mechanical properties of vulcanisates, depending on the period of vulcanisation when using thiuram and sulphur, are shown in Figure 1. Tests on the thermal stability of SKTV-3 and SKTV-1 at 175°, 200°, and 250°C showed that the thermal stability of SKTV-1, SKTV-3 and SKT rubbers was unsatisfactory (Figures 2 and 3). The SKTV-1 rubbers maintained their elasticity at 175°C for 50 days, at 200°C for 30 to 40 days and at 250°C for 4 days. Thick-walled 28 x 32 mm cylinders made from standard mixtures SKT and SKTV-1, and containing powdered silica gel, were also tested. In this case benzoyl peroxide was used as a vulcanisation accelerator. Vulcanisation was carried out for 15 minutes at 150°C. The vulcanised cylinders were subjected to further heat treatment (in a thermostat) for 6 hours at 200°C. The SKT vulcanisates had macro-pores, the SKTV-1 vulcanise had a micro-porous structure (Figure 4). The vinyl groups in the siloxane polymer facilitate the vulcanisation of thick-walled rubber articles. It was also found that with an

Card 2/3

SOV/138-59-4-2/26

Properties of Siloxane Rubber Vulcanisates Containing Vinyl Groups
(SKTV)

increasing number of vinyl groups in the chain the frost resistance of the polymer increases (Table 3). The swelling resistance of siloxane rubber vulcanisates, due to various vulcanisation agents, is given in Table 4. The amount of residual deformation can be decreased by modifying the vulcanisation group and by increasing the time of processing in the thermostat (Table 5). Vinyl-containing siloxane SKTV rubbers are good insulating agents. The dielectric characteristics of vulcanisates SKTV-1 up to the time of swelling, and after swelling for 14 days in water, are given in Table 6. It is also possible to prepare vulcanisates from SKTV-1 by using channel black in the presence of sulphur and TETA. The strength of such vulcanisates, after vulcanisation for 60 minutes at 150°C, equalled 53kg/cm^2 , and the relative elongation equalled 827%. Their thermal stability was unsatisfactory. The elastic properties of vulcanisates were considerably poorer when the period of ageing at 175°C and 150°C was reduced by 50%.

There are 4 figures, 6 tables and 11 references, 9 of which are English and 2 Soviet.

TITLE: Refrigerating Machines Operating on Freon-22

PERIODICAL: Kholodil'naya tekhnika, 1959, Nr 3, pp 21-25, (USSR)

ABSTRACT: Investigations conducted by the Central Designing Bureau of Refrigeration Machine Building and information from foreign manufacturing sources have shown that refrigerating machines operating on Freon-22 at a boiling point of -70° to -80° C should be of the two-step type. Odesskiy zavod imeni Stalina (Odessa Plant imeni Stalin) has started serial production of the first two-step refrigerating machine, the FDS-1, operating on Freon-22. In 1958 Moskovskiy zavod "Kompressor" (Moscow Plant "Compressor") produced the machine FDS-5. Both machines are intended for testing purposes with a temperature in the cold chamber of -60° to -70°C, operating at a boiling temperature of -50° to -80°C. The FDS-1 consists of 2 compressors driven by one electric motor, and of 2 heat exchangers, one gas and one liquid, and is equipped with an automatic control system. The capacity of the FDS-1 is 1,000 kcal-hr and that of the FDS-5 is 5,000 kcal/hr. The FDS-5 consists of 2 compressors with separate driving engines, a condenser with heat exchanger, a control device and an evaporator. Each compressor is equipped with an oil cooler. The article gives a complete list of

Card 1/2

Refrigerating Machines Operating on Freon-22

SOV/66-59-3-5/31

technical data pertaining to both types of compressors. In his conclusion the author concedes the high merits of the freon compressors, which however do not rule out the use of ammonia compressors, which in a capacity of 30,000 to 50,000 kcal/hr and at a boiling point of -50°C maintain their place in industrial installations, where toxicity does not enter into consideration: otherwise, as for instance in air conditioning installations the use of Freon-22 machines is appropriate. The same applies to laboratory and experimental installations requiring a refrigeration temperature of -70°C.

There are 1 photo, 4 graphs, 1 table and 1 diagram.

TITLE: The Tasks of the All-Union Institute of Scientific and Technical Information in the Development of Soviet Science and Engineering.

PERIODICAL: Nová Technika, 1960, No. 3, pp. 131 - 133

ABSTRACT: This is an abridged translation of an article, originally published in a Soviet periodical, entitled in Russian "All-Union Institute of Scientific and Technical Information and Its Tasks". The number of Soviet scientific institutes is about 3,000, the number of scientists about 280,000. The All-Union Institute of Scientific and Technical Information (VINITI) at the State Scientific-Technical Committee of the Council of Ministers of the USSR and the AN USSR was established in 1952. Thirteen series of periodicals containing abstracts are published; 559,000 abstracts, 44,000 of which treated patents, were published in 1958. About 8,000 abstracts describing machines are published monthly; 12,250 foreign periodicals are abstracted. An express information service is engaged in publishing the most current scientific and technical news from abroad; 49 technical and scientific branches are treated. Monographies are also published on special

Card 1/2

The Tasks of the All-Union Institute of Scientific and Technical Information in the Development of Soviet Science and Engineering.

subjects. An independent translation department is attached to the VINITI. A team of about 20,000 experts is employed by the VINITI. Data on future publications, on technical equipment, like selectors, micrōphotographic reproductions etc, used by this Institute follow. There are 2 Soviet references.

21

ABSTRACT: The author treats the problem of a cylinder of magnetic

core in the field of a finite number of conductors parallel to

the axis of the cylinder. The problem is solved by the method of

harmonic analysis. The solution is obtained in the form of a series

of terms which are periodic in time and in azimuth. The force of

attraction and the force on the cylinder are calculated. The

cylinder is assumed to be infinitely thin in the radial direction

and has finite extension in azimuth. The results are obtained

Card 1/2

L 54767-65
ACCESSION NR: AP5015618

in the form of finite sums over the conductors of infinite Fourier series. In case the conductors are infinitely thin also in azimuth, the infinite series can be summed and the results obtained in closed form. There is considerable discussion of the conditions under which the neglect of the finite azimuthal extent of the conductors is justified. Orig.art.has: 41 formulas and 2 figures.

TITLE: An infinite cylinder in the field of a coaxial system of turns

B

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 35, no. 8, 1965, 1438-1443

TOPIC TAGS: electric inductance, induction furnace, skin effect, magnetic field

ABSTRACT: The author calculates the field within an infinitely long cylinder of given conductivity and permeability surrounded by a sequence of current-carrying rings centered on its axis. The author was motivated (at least in part) by the applicability of the calculations to induction heating of cylindrical parts. The field of the rings outside the cylinder is calculated with the aid of a tensor Green's function and the corresponding field within the cylinder is obtained in the form of an infinite series, each term of which is the integral of a product of Bessel and exponential functions. The self and mutual impedances of the rings are also expressed in terms of similar series. In deriving these series it was assumed that the rings are infinitely thin in the radial direction but of finite width in the axial direction. To evaluate the integrals occurring in the series

1/2
Card

L 2308-66

ACCESSION NR: AP5020732

it is now assumed that the rings are narrow also in the axial direction. Other simplifying assumptions are discussed, and for the case of small skin depth and small gap between the current rings and the surface of the cylinder, the calculation of the terms of the series is reduced to the evaluation of tabulated functions. The inductances of several systems were measured and good agreement is shown with the calculated values. (Abstracter's note: No experimental details are given.) Orig. art. has: 42 formulas, 2 figures, and 1 table.

TITLE: Theory of the electrodynamic bearing

SOURCE: Elektrichestvo, no. 2, 1966, 12-14

TOPIC TAGS: dry bearing, electrodynamic bearing, ELECTRODYNAMICS

ABSTRACT: The possibility of building an electrodynamic bearing is proven, and fundamental formulas describing such a bearing are deduced. A set of wires (bearing) produces a magnetic field describable by: $H(r) = H_0 \left(\frac{r}{R_0} \right)^n$. A non-ferromagnetic cylinder (shaft) is placed in this field. So long as the bearing and the shaft are aligned, the resulting force is zero. When an offset δ appears, the

Card 1/2

UDC: 538.3:621.822

L 06071-67

ACC NR: AP6018320

resulting force arises and tends to reduce δ . A solution of the differential equations describing the system yields relations among the force acting upon the shaft, the offset δ , and the field exponent n. The final formulas show that the shaft should be a good electrical conductor, that the supply frequency should not be too high, and that the skin effect should be pronounced. Orig. art. has: 1 figure and 40 formulas.

ABSTRACT: The author calculates the magnetic field produced within a circular cylinder by a system of conductors parallel to the axis and equally spaced on the surface of the cylinder carrying equal currents with a constant phase difference between the currents in successive conductors. The calculation is based on an expression for the vector potential previously given by the author (ZhTF, 35, No. 6, 1958) and the result is expressed as a Fourier series in the azimuth. If the space outside the cylinder is filled with a ferromagnetic material with infinite permeability the field strength within the cylinder is doubled. If d is the phase difference between the currents in successive conductors and there are a total of N conductors in all, the number of phases is $\beta = 2\pi/d$, the number of pole pairs is $p = N/\beta$, and the field near the axis is proportional to r^p , where r is the distance from the axis. This rapid increase of

field strength with distance from the axis is advantageous for the design of electrodynamic supports, electromagnetic crucibles, and magnetic traps. For fixed N, p is maximum when $\beta = 2$, and a two-phase system is recommended for the design of electrodynamic supports. Orig. art. has: 22 formulas, 1 figure, and 1 table.
